

## Matilda Discovery Module

### Do you know- 77% of enterprises have cited compliance as one of the biggest cloud challenges

Understanding on-premise application workload/profiles are the key part of the discovery process.

Discovery and Compliance module helps identify organization assets to evaluate their workload or applications for compliance, asset evaluation, audit and helps prepare for migration to the cloud.

Matilda's discovery module can discover applications and workloads from anywhere. Our discovery platform supports all major OS's.

Our discovery module enables the discovery of the computing mode, memory usage, network elements, security elements, storage, middleware, and software modules.

The visual report generated from Matilda's Discovery Module enables an easy way to view full live inventory for an application or workload.

Matilda's compliance module facilitates custom report generation to help with security audits, PCI compliance, SOX compliance and many more.

## Matilda's Discovery Module Features

Support for wide range network component identification like security, security firewall, proxy elements, network elements, storage types, load configuration, etc.

• Detailed discovery of server resource utilization – CPU, memory, bandwidth, interface speeds, etc.

• Discover security vulnerabilities for all compute devices and operating system level

• Discovery of compute modes configurations and statistics including:

• Memory available in Used.

• Memory available in Used.

• Storage available in Used.

• Type of services including, App Servers, DB Servers

• Deep dive into discovery of middleware software components including WebLogic, JBoss and J2E.

• Supports a wide range of Operating System like Windows (all 32bit, Linux, Solaris and RHEL).

• Data Center Analysis for Cost, Security, Settings, and Governance. More creation of custom Dashboard and reporting for Data Center.

• Wide Range of Reports for Data Analysis.

• Active feature recommendations addressing Security and cloud Migration.

• Interactive Network Topology ( Services and Applications) understanding view.

• Support Discovery for Private Data Center | Cloud Data Center

## 01.

### What is Application Discovery?

"It's a process of understanding and determining your application environment."

Application Discovery gives you details about the existence of physical and virtual assets, also determines the number of applications running on these servers. Gathering the details of an application on the cloud, workloads, profiles, servers, and existing resources and data set helps to build a business case, which can help later to achieve the requirements.

The successful execution of application discovery depends upon the level of proficiency you bring in to generate an application environment. Care generation could be based on existing business processes, operating systems, and business resources information. You can also understand the on-premise or cloud environment as it is configured by yourself. If you know how to extract the details from your existing environment like the existing applications, details of the operating system, existing applications, dependencies on various database and usage of the web system, then you can simplify the information process.

In other words, application discovery collects data from multiple sources, you can utilize this feature to formulate the strategic approach for each group of applications. It also provides the required data for project planning and cost estimation. From which you can get all necessary to set your application discovery service from within the workflow.

However, throughout the process, Configuration Management Database (CMDB) will be the point of contact for every operation you perform. Since it helps to follow the complete analysis of the application discovery, for a lot of safety or time is a challenging aspect. Despite having performance and efficiency in this specific work, ensuring that during the time of discovery and assessment could give more visibility to manage the facility.

## What happens when you're reluctant to conduct the application discovery assessment?

## 02

Difficult to identify what you're assessing.

You may not be able to move the particular tool to the application, which is in your environment.

Difficult to monitor application activities.

You can't determine the evaluation of applications. Hence you'll have to monitor the applications from within the environment. This leads to your application assessment process, which is not a clear choice to identify critical vulnerabilities.

Difficult to discover application jobs.

Unless you discover applications in an existing environment and gather proper views on what you're doing, you'll not be able to identify the applications. This leads to your application assessment process, which is not a clear choice to identify critical vulnerabilities.

Difficult to monitor your valuable assets.

Without the knowledge of running applications, you can't view the critical vulnerabilities. Hence, without proper views on what you're doing, you'll not be able to identify the applications. This leads to your application assessment process, which is not a clear choice to identify critical vulnerabilities.

## Free initial level report on Application Discovery and Assessment for a Successful Cloud Migration

The most compelling and imperative part of application discovery is the discovery and assessment phase. Expected your current infrastructure is driven by multiple resources like data centers or on-premise project teams, extending the information from IT infrastructure, identifying potential issues, documentation, and utilizing discovery capabilities to create a business case to move.

However, throughout the process, Configuration Management Database (CMDB) will be the point of contact for every operation you perform.

Since it helps to follow the complete analysis of the application discovery, for a lot of safety or time is a challenging aspect. Despite having performance and efficiency in this specific work, ensuring that during the time of discovery and assessment could give more visibility to manage the facility.

## Matilda's Discovery Module as a Solution!

Matilda provides a simple way to discover your application's (SaaS) details. Information like: Cloud, Service Data sources, API interfaces, and many other important elements that play a part in an enterprise-level environment.

Matilda's Discovery module enables businesses to discover applications assets, environment, security, network elements, security elements, storage, middleware, and software modules. It also provides the details of the application, and to dependencies facilities like: migration, asset management, and any compliance needs with original level of comprehensiveness and flexibility.

Managing legacy applications is not easy, knowing they also cause the ability of businesses to innovate and cost the profitability. However, the cost, time, and resources required to build business technology workflow is very complex that businesses face with this overhead. Your business resources and investment to simply maintain the legacy system. And Matilda Cloud solves these challenges by helping you to create an effective way to discover and migrate legacy applications to the cloud. Request a demo today to try our Discovery module.
